Giannis Psomas

Junior Data Analyst

Athens, Greece | psomasgiannis2001@gmail.com | +30 695 541 8317 | LinkedIn | GitHub

SUMMARY

Junior data analyst, PL-300 certified, with hands-on SQL Server, Python and Power BI experience. Built an end-to-end retention analysis on 1M+ retail transactions that flagged £3.30M of revenue at risk. Currently validating high-volume records on Greek national platforms under data-protection policies. Fluent in English, with B2 certifications in German and French.

SKILLS

Data and BI: T-SQL, SQL Server, Power BI (DAX, Power Query), Microsoft Excel (XLOOKUP, pivot tables, formulas, Solver)

Python: Pandas, Scikit-learn, Matplotlib, Seaborn

Methods: Data cleaning and validation, data quality assurance, data reconciliation, data modelling (star schema), cohort analysis, logistic regression, marketing attribution, CAC and LTV analysis, credit risk analysis, budget optimization, KPI reporting

Tools: Git / GitHub

PROJECT EXPERIENCE

End-To-End Retail Retention Analysis | SQL Server, Python, Power BI

GitHub | Report (PDF) | Case study | Video walkthrough

Business question: which customers are lapsing, how much revenue is at risk, and who should be re-engaged first?

- **Data modelling:** Built a Kimball star schema in SQL Server from 1M+ transactions, removing 11,812 duplicates and reconciling revenue to £19.64M before any analysis began.
- **Customer segmentation and retention:** Segmented customers with RFM and K-Means and ran T-SQL cohort analysis (CTEs, window functions): repeat customers (72%) generate 97% of revenue, 42 customers alone account for 27%, and retention peaks at about 22% in month 2, so retention should focus on them and the first two months.
- **Churn and Power BI:** Built a logistic regression churn score (ROC-AUC 0.77): 51% of customers are inactive for 90+ days, holding £3.30M of revenue. Delivered it in a Power BI report (21 DAX measures) with win-back recommendations that rank whom to re-engage first.

FinTech Customer Acquisition and Profitability Analysis | SQL Server, Excel (Solver), Power BI

GitHub | Report (PDF) | Case study

Business question: which acquisition channels are profitable after credit risk, and how should the budget shift?

- **Data modelling:** Profiled and cleaned a synthetic 10-table dataset (136K rows) in T-SQL, removing 100 duplicate customers, and defined CAC, LTV, payback and default rate once in 10 reporting views.
- **Channel economics and attribution:** Compared 5 channels on CAC, LTV, payback and position-based attribution: the recorded channel credits paid social about 20% too many customers (CAC 66 becomes 82), and one campaign costs 365 EUR per customer against a channel median of 62.
- **Credit risk:** Traced loan defaults to the acquisition channel: affiliate has the best 12-month LTV (252 EUR) but defaults on 24% of its loans, so only referral earns money per customer after credit losses.
- **Budget model and Power BI:** Built an Excel Solver optimizer tested in 8 scenarios (modelled uplift of about 40,700 EUR for the quarter) and a 5-page Power BI report with 41 DAX measures.

WORK EXPERIENCE

Data Entry Operator | Operators Data Entry Solutions | March 2026 - Present

- Validate and correct duplicate, inconsistent and incomplete records on national platforms (Ktimatologio, e-EFKA, myAADE), keeping high-volume data accurate and audit-ready.
- Maintain data integrity and consistency across records while handling confidential data under data-protection policies.

CERTIFICATIONS

- Microsoft Certified: Power BI Data Analyst Associate (PL-300), 2026 (view here)
- Harvard CS50x, 2024 (view here)
- English C2 (Michigan MET)
- German B2 (Goethe-Zertifikat)
- French B2 (DELF)

EDUCATION

BSc in Tourism Business Management | University of West Attica | Oct 2019 - Dec 2023

Very Good (7.48/10)

Relevant coursework: Mathematics of Administrative Science (9/10) | Tourism Market Research (9/10) | Statistics of Businesses and Organisations (7.8/10)

University projects: Film Tourism in Greece (survey cleaning, validation and hypothesis tests, n = 60) | Entersoft A.E. (ratio analysis with source data audited against annual reports)

MILITARY SERVICE (COMPLETED)

Hellenic Army, Special Forces | Sept 2024 - May 2025
